

Lab 3: Convolutional Neural Networks

Create a notebook containing the following code (with comments):

Part 1: Create a model that classifies images into two classes – cloudy, sunrise

1. Load images from the **weather** dataset (use only two classes: cloudy and sunrise).

Dataset location: <http://www.kasprowski.pl/datasets/weather.zip>

2. Create a Convolutional Neural Network classifying into two classes.
3. Train the network on 75% of the images.
4. Test the network on the remaining images.
5. Present the results (confusion matrix, accuracy, kappa and so on).

Part 2: Create a model that classifies images into all four classes

Repeat steps from Part 1 but this time for all four classes from the dataset **weather**.

Add the code to the same notebook!
